

Hi everyone!

My name is **Mihai Catalin Teodosiu** and I am an instructor on Udemy and other websites.

Welcome to this Python course! I really hope you are going to find it useful for your career.

Now, what is the important information?

Well, nothing to be scared about.

I just wanted you to know that this course has been extracted from a larger course of mine, called “Python and Network Automation: Build 5 Python Apps”.

That is a course that contains the course you just enrolled into and a second part about Network Automation and building network applications. I decided to do this because some people are interested in just the Python part of the course and others are interested in the networking part as well. So I made this separation to cover both sides.

That's why you may encounter, here and there, some short references to networking or future network applications. I just wanted you to know that, but rest assured that 99.9% of this course is about the pure Python language and learning it in a completely original way: **at the Python prompt, writing code, 100% hands-on, 0% boring slides and theory.**

To further enhance your Python knowledge, you should check the additional section of most lectures, because I will include very useful documents and links to great resources on the web.

P.S.: For any questions, do not hesitate to open a discussion in the course dashboard or send me a private message on Udemy. You have my full support in your Python programming adventure. Also, stay tuned in the months to come for a lot of updates.

Having that said, I wish you happy learning!

All the best,

Mihai
